Education

University of California, San Diego

Expected Graduation: June 2027

B.A. - Interdisciplinary Computing and the Arts (Music), minor in Electrical Engineering

- Coursework: Digital Signal Processing, Machine Learning for Music, Music Programming, Circuits and Systems

Experiences

Sonic Arts R&D - Undergraduate Researcher

July 2026 - Present

Qualcomm Institute, under Professor Shahrokh Yadegari

- Working on the Space3D project, a **real-time ray-tracing spatial audio rendering engine**, integrating the optimized HRTF interpolation pipeline and beginning work on an existing lab model for **ML-based HRTF personalization**.
- Optimized the lab's existing SOFA preprocessing codebase to auto-orient files and map measurements onto a consistent coordinate system before HRIR truncation, improving the interpolation pipeline's runtime efficiency by **~6x**.
- Generalized the lab's per-database triangle-mesh builders into a single **KNN-based builder**, extending interpolation support to any SOFA file rather than four hardcoded databases.

UCSD Jacobs School of Engineering - ECE Makerspace Lab Assistant

September 2026 - Present

- Maintained **fabrication and electronics equipment** (3D printers, laser cutters, soldering stations) and tracked inventory, while training students and faculty on safe operation and troubleshooting.

Projects

Theramen - Contactless Synthesizer with Multi-Device I2C Coordination

July - September 2026

<https://github.com/vivianyunjinyu/theramen>

- Developed **embedded C++ firmware** on an STM32H750 microcontroller, implementing **driver logic** for two I2C time-of-flight sensors alongside real-time audio synthesis and OLED display output.
- Debugged an I2C address collision between identical sensors via hardware reset sequencing, then optimized I2C bus utilization by batching display writes into single burst transactions to sustain real-time sensor polling.

Vocoduh - FFT Channel Vocoder

May - June 2026

<https://github.com/vivianyunjinyu/FFT-Vocoder-Plugin>

- Developed a **real-time audio signal processing algorithm** (FFT/STFT-based channel vocoder) in C++, replacing a fixed filter-bank architecture with finer frequency-bin decomposition for improved frequency resolution.
- Implemented tunable audio processing controls (frequency-weighted noise injection, spectral whitening) to improve signal clarity, enabling user-adjustable audio quality tuning.

Whoosh - Tempo-Synced LFO Tool

June 2026

<https://github.com/vivianyunjinyu/Whoosh-Plugin>

- Engineered a computationally efficient **DSP lookup-table cache** with dirty-flag regeneration, reducing runtime cost by replacing per-sample power-function evaluation with interpolated lookups.
- Synchronized real-time audio processing to host DAW tempo, eliminating dependency on external audio input.

Skills

Programming: Python (PyTorch, TensorFlow, scikit-learn, Pandas), C++ (Embedded), Java, MATLAB, Simulink

Embedded Sys and SBCs: Arduino, ESP32, STM32, Electrosmith Daisy, Raspberry Pi

Tools & Formats: Git/GitHub, LTSpice, Onshape, PureData

Lab Equipment: Keysight Oscilloscope, Multimeter, Power Supply, Waveform Generator, Soldering Tools

Audio/Video: AVID Pro Tools (Certified Specialist), Ableton Live, Adobe Premiere, DaVinci Resolve

General: Microsoft Office (Word, Excel, PowerPoint), Google Workspace, Canva
